The 5-Skill Install Pack

Exact install commands, first run, and gotchas for all five

You commented **SKILLS**. Here is the build.

01. superpowers (methodology)

The skills framework that makes your agent work like a senior dev: it steps back, asks what you are really building, then plans and tests before writing code.

253,676 stars as of July 13, 2026. Source: github.com/obra/superpowers.

Install (official Claude plugin marketplace):

```
/plugin install superpowers@claude-plugins-official
```

First run: start any build task in Claude Code. Superpowers takes over from the first message: instead of jumping into code it interviews you about the goal, then drives brainstorm, plan, and implementation.

Gotchas: installation differs by harness. If you use more than one agent (Claude Code plus another), install Superpowers separately for each one. An alternative marketplace route exists: `/plugin marketplace add obra/superpowers-marketplace` then `/plugin install superpowers@superpowers-marketplace`.

02. claude-mem (memory)

Persistent context across sessions: it captures what your agent does, compresses it with AI, and injects the relevant memory back into future sessions.

87,074 stars as of July 13, 2026. Source: github.com/thedotmack/claude-mem.

Install (one command):

```
npx claude-mem install
```

First run: just keep working. Capture is automatic; context from previous sessions appears in new sessions, and semantic search runs across your past work.

Gotchas: `npm install -g claude-mem` installs the SDK/library only. It does NOT register the plugin hooks or start the worker service. Always install via `npx claude-mem install` or the `/plugin` commands.

03. caveman (token cost)

Your agent drops filler, hedging, and pleasantries and answers in tight caveman-speak, keeping code, commands, and errors byte-for-byte exact. The creator reports about 65 percent fewer output tokens. 88,974 stars as of July 13, 2026. Source: github.com/JuliusBrussee/caveman.

Install (Claude Code plugin, two commands; the README chains them with &&):

```
claude plugin marketplace add JuliusBrussee/caveman  
claude plugin install caveman@caveman
```

First run: on Claude Code it is on from message one, no command needed. Toggle with `/caveman` on and "normal mode" off. `/caveman-stats` shows real token savings.

Gotchas: the one-command multi-agent installer needs Node 18 or newer. Silence the statusline counter with `CAVEMAN_STATUSLINE_SAVINGS=0`. The 65 percent figure is creator-reported, not independently measured.

04. frontend-design (UI taste)

Anthropic's own skill for distinctive, production-grade interfaces instead of generic AI-looking UI. It ships inside the official anthropics/skills repository, 160,822 stars as of July 13, 2026. Source: github.com/anthropics/skills.

Install (register the official marketplace, then the example-skills plugin):

```
/plugin marketplace add anthropics/skills  
/plugin install example-skills@anthropic-agent-skills
```

First run: after installing, just mention the skill in a frontend task. Skills load automatically when the task needs them.

Gotchas: the repo publishes multiple plugins. `frontend-design` lives in `example-skills`, not `document-skills` (that bundle is docx/pdf/pptx/xlsx). Installing the wrong bundle is the common miss.

05. skill-creator (build your own)

The meta-skill: it helps you package any repeated workflow into a new skill your agent keeps forever. Same official anthropics/skills repository as frontend-design. Source: github.com/anthropics/skills.

Install: included in the same plugin as 04:

```
/plugin marketplace add anthropics/skills  
/plugin install example-skills@anthropic-agent-skills
```

First run: ask Claude to "use skill-creator to turn my release checklist into a skill." It interviews you, then writes the SKILL.md folder for you.

Gotchas: one install covers both 04 and 05, so if you set up frontend-design you already have skill-creator. Keep your custom skills small and single-purpose; a skill

is a folder with instructions, not an app.

Sources and freshness

Every claim above was verified live on July 13, 2026 against the linked GitHub repositories (API snapshots retained). Star counts move daily; commands are stable. If a command fails, the repo README is the source of truth.
